

Cheap to build. Expensive to trust.

Why "Build, Buy, ...Vibe?" is really a question about who reviews the code, not who writes it.

Generation got cheap. Verification did not.

4.6x

longer wait in code
review for AI-authored
pull requests

2.74x

the vulnerability rate of
human-written code (upper
bound)

Routine tasks got 46% faster. High-complexity work:
under 10%. The queue didn't disappear; it moved
downstream.

The review gate is the new constraint

Volume entering each stage

pile-up: 4.6× longer wait

Raw throughput = PRs opened.

Validated = merged, shipped, no rollback.

When building stops being expensive, does the case for buying become "we can't afford to review it"?

Build · Buy · Vibe. Three lanes, one gate. Monday's panel decides which lane survives the review queue.
